The CDNA clones were in vivo excised to give pBluescript phagemids before normalization was carried out. The mass excision of phagemid library and normalization were done in HT Nguyen lab by D. Zhang at Texas Tech University. Normalization protocol used was that of Soares. Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /dev_stage="Five day old etiolated seedling"

Roots were harvested. The tissue, total RNA, and poly(A) RNA were prepared, a cDNA library was made in the TJ Close lab (Choi, Close, Fenton) at the University of California, Riverside. The CDNA clones were in vivo excised to give pBluescript phagemids before normalization was carried out. The mass excision of phagemid library and normalization were done in HT Nguyen lab by D. Zhang at Texas Tech University. Normalization preparations and DNA sequencing were performed in the OD Anderson lab (all other authors). "

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       30 and 45 DAP (Fenton). Total RNA was prepared from each pool, equal quantities of all six RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified cDNA library was made, and 1 million ptu were in vivo excised to give pBluescript SK(-) cDNA phagemids (Choi)in the TJ Close lab at the University of California, Riverside. Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sequence analysis see

The mass excision of phagemid library and normalization were done in HT Nguyen lab by D. Zhang at Texas Tech Univeristy. Normalization protocol used was that of Soares. Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors)."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                dishes. Roots were harvested. The tissue, total RNA, and poly(A) RNA were prepared, a cDNA library was made in the TJ Close lab (Choi, Close, Fenton) at the University of California, Riverside. The cDNA clones were in vivo excised to give pBluescript phagemids before
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /tissue_type="Root"

Seeds were surface sterilized then germinated under axenic conditions in the dark at room temperature on filter paper with water, nystatin and cefotaxime in covered crystallization dishes. Five-day old seedlings were incubated at 50c for 2 days. Shoots were then harvested, total RNA was prepared, poly(A) RNA was purified, one primary unamplified cDNA library was made, and 600000 pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids. These steps were performed in the TJ Close laboratory at the University of California, Riverside (Choi, Close, Fenton). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begun, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above. For more details on library preparation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Conservative

/inte_1: ECOR I; Site_2: Xho I; Testes dissected from 1-5
day adult y(*) w(67c1)/Y males raised at 25oC. RNA
isolated using Trizol (Life Technologies) and a single
round of Poly(A)+ selection using Oligotex (Qiagen). cDNA
library constructed using Stratagene ZAP-cDNA syntesis
kit. Oligo dT-primed, size fractionated -1-6 kb, and
directionally cloned at EcoRI and XhoI in Uni-ZAP XR.
Following a single round of amplification pBlueScript SK
phagemids were mass excised. A distribution channel for
clones is being sought, but not currently available.
Requests for clones cannot be honored."

//note="Organ: testis; Vector: pBlueScript SK (Stratagene);
Site_1: EcoR I: Site_2: Xho I: Testes dissected from 1-5
day adult y(*) w(67c1)/Y males raised at 25oC. RNA
isolated using Tritol (Life Technologies) and a single
round of Poly(A)+ selection using Oligotex (Oligen). CDNA
ilbrary constructed using Stratagene ZAP-cDNA syntesis
kit. Oligo dT-primed, size fractionated ~1-6 kb, and
directionally cloned at EcoRI and XhoI in Uni-ZAP XR.
Following a single round of amplification pBlueScript SK
phagemids were mass excised. A distribution channel for
clones is being sought, but not currently available.
Requests for clones cannot be honored."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       synthesized as described previously (Adams, M. D. et al. Nature Genet. 4, 373-389, 1993). cDNA was ligated to a two fold molar excess of a NotI/HindIII digested plasmid DNA (lafmid BA vector, a phagemid derived from pEMBL, Adams, M. D. et al. Nature Genet. 4, 373-389, 1993) and electroporated into E. coli strain DH10B (BRL). The library was amplified and further selected for clones containing long inserts (>500 bp) by purification of the plasmid DNA from a fragment of a 1% low-melting-point agarose gel, containing the smear of the library and electroporation into DH10B cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    gfrancoemono.icb.ufmg.br
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ø

D. et al. Nature Genet. 4, 373-389, 1993)) and electroporated into E. coli strain DH10B (BRL). The library was amplified and further selected for clones containing long inserts (>500 bp) by purification of the plasmid DNA from a fragment of a 1% low-melting-point agarose gel, containing the smear of the library and electroporation into DH10B cells.               Direct Submission
Submitted (10-DEC-2000) Trypanosoma brucel genome sequencing
project, Sanger Centre, The Wellcome Trust Genome Campus, Hinxton,
Cambridge CB10 1SA, E-mail: barrell@sanger.ac.uk and
nhl@sanger.ac.uk
Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TREU927/4 GUTat 10.1) was mechanically sheared
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Expressed Sequence Tags from the Samuel Medicago truncatula stem library Unpublished (2000) on Apr 14, 2000 this sequence version re Contact: Dixon RA

Constructed at the Institute for Genomic Research (TIGR), Rockville, MD. Genomic DNA isolated from a cloned population of Trypanosoma brucei (TREU927/4 GUTat 10.1) was mechanically sheared to give a tight size distribution (

4 kb). The v + i method used for the library construction is described in detail in Smith, H. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barrell, Oxford University Press, 1999).

Constructed at the Institute for Genomic Research (TIGR), Rockville, MD. Genomic DNA isolated from a cloned population of Trypanosoma brucel (TREU927/4 GUTat 10.1) was mechanically sheared to give a tight size distribution (

4 kb). The v + 1 method used for the library construction is described in detail in Smith, H. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barrell, Oxford University Press, 1999).

The method involves performing a sequencing procedure, with or without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the rposh, katG, rpsi/s12 and 23S genes for the presence of antibiotic inducing mutations. If M. tuberculosis is detected, a second sequencing procedure is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antibiotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       25-SEP-2000 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     performed on the sample to evaluate additional genes for the presence of antibiotic resistance-inducing mutations. Genotypic tests are rapid, sensitive and acceptance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  rpoB (rifampin resistance) gene amplification primer rpoB-R (bp 2611-2592). It is used with the forward primer given in AAA49823 and with the sequencing primers given in AAA49825 and AAA49826 for the detection and analysis of antibiotic resistance-associated mutations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 20 BP; 4 A; 6 C; 5 G;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 rpoB (rifampin resistance) gene sequencing primer rpoB-3s (bp 2611-2592). It is used with the forward primer given in AAA49825 and CC with the amplification primers given in AAA49824 for the code detection and analysis of antibiotic resistance-associated mutations cof the rpoB gene (see AAA49863). Amplification and cycle sequencing primers (see AAA49823-62) have been developed for the detection and cc analysis of antibiotic resistance-associated mutations in defined cc regions of rpoB (rifampin), kat6 (isoniazid), oxyR-aphC PR (isoniazid), mabA (isoniazid), rpsL/sl2 (streptomycin), l65/rrs (ciprofloxacin) and 23S (azithromycin) genes of M. tuberculosis. CC These primers can be used in a method for the detection and cc characterization of M. tuberculosis present in a sputum sample. CC without prior amplification, to detect the presence of M. CC tuberculosis, and if present to evaluate the rpoB, kat6, rpsL/sl2 cand 23S genes for the presence of antibiotic resistance-inducing mutations. Genotypic cests are rapid, sensitions and accurate providing information as to antiphicia crasimant contains.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PCR amplification was used to obtain rpoB genes iron with the resistant Mycobacterium leprae strains. A comparison with the sequence of the rpoB gene from sensitive strains (AAQ51532) revealed mutations in the region encoding amino acids 400-450. The corresp.

----ion was isolated from M tuberculosis (AAQ61457). A common
                                                                                                                                WPI;
         rpoB (rifampin resistance) gene (bp2161-2640). Amplification and cycle sequencing primers (see AAA9923-62) are used for the detection and analysis of antiblotic resistance-associated mutations in defined regions of rpoB (rifampin), katG (isoniazid), oxyR-aphC PR

These primers can be used in a method for the detection and characterization of M. tuberculosis present in a sputum sample. The method involves performing a sequencing procedure, with or without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the rpoB, katG, rpsL/Sl and 23S genes for the presence of a second sequencing procedure is If M. tuberculosis is detected, a second sequencing procedure is performed on the sample to evaluate additional genes for the
                       Cleavage of nucleic acids using an enzyme, especially a nuclease selected from the group consisting of Cleavase (RTM) BN enzyme, Thermus aquaticus DNA polymerase, Thermus thermophilus DNA polymerase, Escherichia coli ExoIII and the Saccharomyces cerevisiae Radi/Radio complex. The nucleic acid substrate is preferably an
                                                                                                                                                                            WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
       Cleavage of nucleic acids using an enzyme, especially a nuclease selected from the group consisting of Cleavase (RTM) BN enzyme, Thermus aquaticus DNA polymerase, Thermus thermophilus DNA polymerase, Escherichia coli ExoIII and the Saccharomyces cerevis Radl/Radl0 complex. The nucleic acid substrate is preferably an oligonucleotide containing a human p53 gene sequence or alternatively, microbial gene sequences. Cleavage products are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 compared to the cleavage products of reference gene sequences. The method is used for detecting mutation in the human p53 gene; for identifying strains of microorganisms, especially bacteria selected from the the group of members of the genera Campylobacter, Escherichia, Mycobacterium, Salmonella, Shigella and Staphylococcus. The method may also be used for the identification of viruses, especially hepatitis C virus (HCV) and similar immunodeficiency virus (SIV). Two primers (AAT29122, AAT29123) were used to amplify a 620 bg region of the Mycobacterium tuberculosis rpoB gene, which, when mutated is associated with rifampin resistance. The 620 bg region amplified spans both the H451Y and S456L mutations. The amplified fragments are given in AAT29124 (Wild type) and AAT29125-26
                                                                                                                                                                                                                                                                                                                                                     WPI; 1996-259862/26
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 620
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       mutant sequences).

The method is used for detecting mutation in the human p53 gene; for identifying strains of microorganisms, especially bacteria selected from the the group of members of the genera Campylobacter. Escherichia, Mycobacterium, Salmonella, Shigella and Staphylococcus. The method may also be used for the identification of viruses, especially hepatitis C virus (HCV) and simian immunodeficiency virus (SIV). Two primers (AAT29122, AAT29123) were used to amplify a 620 bp region of the Mycobacterium tuberculosis rpoB gene, which, when mutated is associated with rifampin resistance. The 620 bp region amplified spans both the HA51Y and S456L mutations. The amplified fragments are given in AAT29124 (Wild type) and AAT29125-26 (mutant sequences).
        Cleavage of nucleic acids using an enzyme, especially a nucleat selected from the group consisting of Cleavase (RTM) BN enzyme Thermus aquaticus DNA polymerase, Thermus thermophilus DNA polymerase, Thermus thermophilus BNA polymerase, Scherichia coli ExoIII and the Saccharromyces care Radl/RadlO complex. The nucleic acid substrate is preferably oligonuclectide containing a human p53 gene sequence or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       identifying strains of microorganisms, especially bacteria selected from the the group of members of the genera Campylobacter, Escherichia, Mycobacterium, Salmonella, Shigella and Staphylococcus. The method may also be used for the identification of viruses, especially hepatitis C virus (HCV) and simian immunodeficiency virus (SIV). Two primers (AAT29122, AAT29123) were used to amplify a 620 bp region of the Mycobacterium tuberculosis rpoB gene, which, when mutated is associated with rifampin resistance. The 620 bp region amplified spans both the H451Y and S456L mutations. The amplified fragments are given in AAT29124 (Wild type) and AAT29125-26

                                                             This oligonucleotide DNA primer is specific for Mycobacterium tuberculosis, and may be used to amplify a sample DNA by targeting a portion of the gene encoding rpoB. The lst several bases comprise nonhybridizing tail consisting of filler bases followed by a restriction site incorporated to facilitate cloning using the amplicon at a later date, if desired. The remaining bases hybridize to bacterial rpoB DNA. The method provides for the detection of M. tuberculosis and the concurrent determination of its drug susceptibility, particularly to rifamycin. The method can provide often greater than 95% sensitivity and 100% specificity. The biological sample is a fluid or tissue sample from a human.
                                                                                                                                                                                                 Detection of Mycobacterium tuberculosis - \ensuremath{\mathbf{w}} ith a primer set that targets portions of

                                                                                                                                                                                                                                                          This invention relates to a method for identifying a nucleotide or polypeptide sequence that may be a drug target, or essential for growth or viability of an organism. Polypucleotide sequences AAH51947 - AAH52092 represent DNA encoding proteins AAG81096 - AAG81241, Mycobacterium tuberculosis proteins which are potential drug targets. The DNA and protein sequences are used to illustrate the method of peptide sequences, and comparing it to a number of sequences along with at least one algorithm capable of analysing a functional relationship between nucleotide and polypeptide sequences. The method is useful for characterising the function of nucleic acids and polypeptides that may be useful as a target for a drug or essential for the growth or viability of an organism.

                                                                                                                                                                                       CC nucleic acids of the first fus, amb and/or recA genes from which probes and/or primers are derived. The method comprises amplifying the nucleic acids of determined algal, archaeal, bacterial, fungal and parasitical cc species with a combination of defined primer pairs. The method can be used for producing probes and/or primers for detecting one or more crelated microorganisms e.g. algae, archaea, bacteria, fungal and correct contact and information and identification of an algal, archaeal, bacterial, fungal and correction and identification of an algal, archaeal, bacterial, fungal cc and parasitical species, genus, family and group. A nucleic acid (I) cobtained using the method of the invention can be used for the universal detection of any bacterium, fungus or parasite in a sample and for the ce detection of any bacterium, fungus or parasite in a sample and for the last one toxin gene. hexa nucleic acids are used for the specific and uniquitous detection and for identification of Streptococcus pneumoniae. (I) can be used to design a therapeutic agent which is effective against cmicroorganisms. Microbalal species or genus or family or phylum or group corresponded to the species of genus or family or phylum or group corresponded to the species and staphylococcus sp. Streptococcus sp., which can be detected include Abiotrophia addacens, Bordetella sp., corresponded in an hour and improved accuracy is also achieved.

CC Mah00010 to AAH002304 represent nucleotide sequences and primers/probes which are given in the exemplification of the present invention.

To detect a mutation, a complex is formed comprising a first sequence representing the predetermined region of the gene of the organism and a second sequence representing the corresponding region of the gene of the wild type organism in double stranded form. Each member of at least one pair of non-complementary stranded form. Each member of at least one pair of non-complementary stranded within the complex has a label. The association of the labels in the complex is related to the presence of the mutation. The presence of
                                                                                                                                                                                                                                           2122
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is the rooB gene from Mycobacterium tuberculosis. Rifampin resistance is largely associated with point mutations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      06-DEC-2000
                 Mycobacterium tuberculosis
                                           RNA polymerase beta subunit;

The method comprises detecting the presence of a least 1 mutation in a first sequence and relating the presence of the mutation to drug resistance. Included in the invention are a kit for carrying out the method and a method for detecting the presence of a difference between two related nucleic acid sequences in an organism. I methods are useful for detecting resistance to drugs such rifampin and pyrazinamide in Mycobacterium. The present sequence represents the Mycobacterium tuberculosis rpoB gene (which encodes the RNA polymerase beta subunit). The sequence is used in an example of the method of the invention for the detection of rifampin resistance in M. tuberculosis.
